IM(G): One time ComCam Image Ingestion and MTAOS Correction

This notebook is used to execute the LVV-T2228 (1.0) test script during System Spread Integration Tests on Level 3.
It is part of the plan LVV-P81 and of the test cycle LVV-C176.
Execution steps are separated by horizontal lines.
Upon completion, save the notebook and its output as a pdf file to be attached to the test execution in JIRA.

In summary, you slew to a target and start tracking. Then you find the Wavefront Error as Zernike Coefficients,
convert them to corrections to be applied to M1M3, M2, Camera Hexapod and M2 Hexapod. Finally you stop tracking.

```
from lsst.ts import utils
import yaml

# Extract your name from the Jupyter Hub
__executed_by__ = os.environ["JUPYTERHUB_USER"]

# Extract execution date
__executed_on__ = utils.astropy_time_from_tai_unix(utils.current_tai())
__executed_on__.format = "isot"

# This is used later to define where Butler stores the images
summit = os.environ["LSST_DDS_PARTITION_PREFIX"] == "summit"

print(f"\nExecuted by {__executed_by__} on {__executed_on__}."
      f"\n  At the summit? {summit}")
```

  At the summit? True
```

Initial Setup

log onto the summit nublado
https://summit-lsp.lsst.codes/
git clone the ts_notebook repo

There will be a series of procedures to set up, "slew" and track the telescope before we get an image.
This is similar to test case LVV-T2189.

Check ComCam Playback Mode

Verify that ComCam can be use the playback option and that the required images are stored in the right place **TBD**.

Load all the needed libraries

Using the setup procedure, get the remotes and the components ready.

This includes simulators as well as real hardware when available (this will depend on when the test is conducted at NCSA or on level 3 or on the telescope):

- pointing
- mount (with the CCW)
- rotator
- ready M1M3: raise mirror, turn on FB, clear forces. Note that if used at level 3, we need to have M1M3 LUT use mount telemetry
- ready M2: turn on FB, clear forces. Note that if used at level 3, we need to have M2 LUT use mount telemetry
- Get cam hex Ready: check config; make sure LUT is on and has valid inputs; make sure hex is at LUT position
- Get M2 hex (simulator) Ready: check config; make sure LUT is on and has valid inputs; make sure hex is at LUT position
- Finally, get the MTAOS CSC ready

Slew and Track

Using the slew procedure, slew the systems to a specific elevation, azimuth and rotator angle. Verify that the telemetry is generated.

Slew to **RA 20:28:18.74** and **DEC -87:28:19.9** with **rot_type=RotType.Physical** and **Rotator Angle of 0°**. We use this field because it is the field that was simulated and that is a field that is visible the whole year.

RotType Physical Ensures that the Rotator will not move. This is necessary because the CCW is not running (MTmount in simulation mode).

Slew to target:

Take in-focus image

Once the different components are ready (M1M3, M2, rotator and CCW, hexapods) and tracking, take an image using the take_image command in playback mode.
This second image should be the one that uses the correction calculated with the first slew.

In [36]:
```
exp_focus = await comcam.take_object(15)
print(f"Target exposure: {exp_focus}")
```

Intra Focus Position

Using the Camera Hexapod, piston ComCam +1mm

In [37]:
```
await mtcs.move_camera_hexapod(x=0,y=0,z=1000,u=0,v=0, w=0)

Intra Focus Image

While tracking, take an image with ComCam and check that the header is containing the right telemetry

In [38]:
```
exp_intra = await comcam.take_object(15)
print(f"Target 1 exposure: {exp_intra}")
```

```
setup.ComCam DEBUG: Generating group_id

Extra Focus Position

Using the Camera Hexapod, piston ComCam to -1mm

In [39]:
```
await mtcs.move_camera_hexapod(x=0,y=0,z=-1000,u=0,v=0, w=0)
```

```

Extra Focus Image

While tracking, take an image with ComCam and check that the header is containing the right telemetry.

In [40]:
```
exp_extra = await comcam.take_object(15)
print(f"Target 1 exposure: {exp_extra}")
```

```
setup.ComCam DEBUG: Generating group_id
setup.ComCam DEBUG: imagetype: OBJECT, TCS synchronization not configure

```

Go Back to Focus Position

Put the hexapod back to 0mm.

```
await mtcs.move_camera_hexapod(x=0,y=0,z=0,u=0,v=0, w=0)
```

```

```

Stop Tracking

If using MTMount Simulator and CCW Following Mode Disabled, stop tracking to prevent the Rotator to hit the limit switches.

In [42]:
```
await mtcs.stop_tracking()
```

```
setup.MTCS DEBUG: Stop tracking.
